

# Bonus ideas

This document outlines proposed enhancements to the Real Estate Simulation Engine, grouped into two categories: **Core Platform Enhancements** to improve accuracy and value, and **Innovative Features** to expand its functionality.

---

## Part 1: Core Platform Enhancements

### 1. Internal Knowledge RAG

**Overview:** Build a vector database of past deals—scenarios, strategies, agent notes, and outcomes.

**Benefit:** Enables Retrieval-Augmented Generation (RAG) based on proprietary data, making recommendations more relevant and grounded in the firm's experience.

### 2. Real-Time Property Valuation

**Overview:** Integrate with live data providers (e.g., Rightmove, Zoopla) via API.

**Benefit:** Provides accurate pricing and comps in real time, enhancing pricing precision and negotiation power.

### 3. Curated Web Search

**Overview:** Limit searches to high-authority sources (e.g., Knight Frank, ONS, FT).

**Benefit:** Improves reliability and quality of insights by reducing noise from less credible content.

---

## Part 2: Innovative Features

### 4. Buyer Agent Persona & Red Teaming

**Overview:** Simulate buyer responses (e.g., objections, counteroffers) using an LLM.

**Benefit:** Helps agents anticipate reactions and refine strategies before going to market.

### 5. Generative Marketing Content

**Overview:** Auto-generate listings, social posts, and email templates based on strategy.

**Benefit:** Saves time and ensures consistent messaging across platforms.
